PRIORITY DOCUMENT

SUBMITTED OR TRANSMITTED IN COMPLIANCE WITH RULE 17.1(a) OR (b)

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Request for grant of a patent

(See the notes on the back of this form. You can also get an explanatory leaflet from the Patent Office to help you fill in this form)

1. Your reference. GBP290117

2. Patent application number (The Patent Office will fill in this part) 0404534.0

0 1 MAR 2004

3. Full name, address and postcode of the or of each applicant (underline all surnames)

AIMSCO Limited,
4 Gildredge Road
Eastbourne
East Sussex BN21 4RL
United Kingdom

8619546001

Patents ADP number (if you know it)

If the applicant is a corporate body, give the country/state of its incorporation United Kingdom

4. Title of the invention Treatment Of Canines

5. Name of your agent (if you have one)
"Address for service" in the United Kingdom to which all correspondence should be sent (including the postcode)

Marks & Clerk
66-68 Hills Road
Cambridge

Treatment of canines

FIELD OF THE INVENTION

The present invention relates to a method of treatment of skin disorders in animals; in particular, but not exclusively, the invention relates to a method of treatment of canine atopic dermatitis. Certain aspects of the invention relate to a medicament for treatment of such diseases.

BACKGROUND OF THE INVENTION

Canine atopic dermatitis is a common problem affecting around 15% of dogs, with the principal symptom being pruritus (itching) initially round the face, axilla, front legs and later over the trunk.

Canine atopic dermatitis is generally caused by an allergic response to allergens such as pollens, grasses, dust mites and moulds. Secondary skin infections may also develop, leading to great discomfort for the animal.

Current therapies generally take a number of approaches:

1. The allergic reaction may be blocked, by anti-inflammatory therapy. Steroids can be given orally or by injection and may be combined with antihistamines and fatty acid supplements.

2. Relief from itching may be given by use of topical agents.

3. The allergic reaction may be reduced by means of hyposensitisation. Once specific allergy sources are identified, small amounts of the antigens are injected regularly to desensitise the animal. Injections usually need to be continued for a significant length of time, with the treatment being relatively expensive. Further, success rates are limited.

4. Cyclosporins may be used as a treatment for atopic dermatitis.

There is a need for an alternative treatment for canine atopic dermatitis.

PCT publications WO 03/004049 and WO 03/064472 describe therapeutic agents and treatments which are based on a serum composition with many surprising beneficial effects. The respective content of each of these two texts is incorporated in full by specific reference. In particular, the reader is referred to them for an understanding of how the therapeutic agent can be prepared, and for the indications which can be treated.

Typically a goat is immunised with HIV-3B viral lysate raised in H9 cells. The resulting serum is believed to be active against HIV, and multiple sclerosis. The reader is further referred in particular to the section on pages 3 and 4 of WO03/004049 headed 'Example of Production of Goat Serum' for further details of the production of serum. This section is incorporated herein by reference.

In addition to the uses described in the earlier PCT publications, it has been surprisingly identified that the serum composition may be active against canine atopic dermatitis.

SUMMARY OF THE INVENTION

According to a first aspect of the present invention, there is provided a method of treatment of a skin disorder in a canine, the method comprising administering a serum composition obtained from a goat after challenge with an immunogen.

The immunogen may comprise HIV. This may be presented in intact host cells, in cell-free extracts, as a viral lysate, or in a mixture thereof.

Alternatively, in a variation of the invention, following heat inactivation of a supernate solution upon which a viral culture has been grown or which is capable of the same, but has not been used to grow a culture, may also be used as an immunogen which will produce a suitable response. Any supernate solution or other medium which is suitable for the in vitro growth of HIV or another virus may be used to produce an acceptable immunogen, which will produce an effective response. The supernate of a cell culture growth medium such as PMBC or the cancer immortal cell line as used to grow HIV 3b are given as an example. The HIV or other selected virus does not need to be present to produce an effective immunogen to create the composition.

Other suitable immunogens are recited on pages 12 and 13 of WO03/064472, the contents of which are incorporated herein by reference.

The animal to be treated is preferably a dog.

The skin disorder to be treated is preferably dermatitis, and more preferably atopic dermatitis.

An example of preparation of goat serum is given below.

The serum composition is preferably administered in a dosage of between 0.01 and 10 mg/kg to the subject; more preferably between 0.01 and 5 mg/kg, between 0.05 and 2 mg/kg, and most preferably between 0.1 and 1 mg/kg. The precise dosage to be administered may be varied depending on such factors as the age, sex, and weight of animal, the method and formulation of administration, as well as the nature and the severity of the skin disorder to be treated. Other factors such as diet, time of administration, condition of the animal, drug combinations, and reaction sensitivity may be taken into account.

The serum composition may be administered by any effective route, preferably by subcutaneous injection, although alternative routes which may be used include intramuscular or intralesional injection, oral, aerosol, parenteral, or topical.

An effective treatment regimen may be determined by the clinician or veterinarian responsible for the treatment, and may depend on factors such as the age, sex, weight of the animal, the method of administration, and the nature and severity of the disorder to be treated. Other factors such as diet, time of administration, condition of the animal, drug combinations, and reaction sensitivity may be taken into account. One preferred regimen for the treatment of canine atopic dermatitis is the subcutaneous injection of between 0.1 and 0.5 mg/kg of serum composition in a liquid formulation. A single dose is thought to offer an improvement in the condition of the animal for some 2 to 5 days. An alternative treatment regimen, which may be suitable for more severe conditions, is the administration of 1 mg/kg serum composition by subcutaneous injection once daily for one week. Injections may need to be repeated at weekly to monthly intervals indefinitely in order to control the condition.

The serum composition may, but need not, comprise anti-HLA antibody. It is believed that this may play a role in the activity of the serum.

A further aspect of the invention provides a method of treatment of a skin disorder in a canine, the method comprising administering a serum composition obtainable from a goat after challenge with an immunogen.

The present invention also provides the use of a serum composition obtained from a goat after challenge with an immunogen in the manufacture of a medicament for the treatment of a skin disorder in a canine. The use of a serum composition obtainable from a goat after challenge with an immunogen in the manufacture of a medicament for the treatment of a skin disorder in a canine is also provided.

Also provided is a pharmaceutical composition for the treatment of a skin disorder in a canine, the composition comprising a serum composition obtained from a goat after challenge with an immunogen, suitable for administration to a subject animal.

Examples of pharmaceutical compositions include any solid (tablets, pills, capsules, granules, ointments, etc) with suitable composition for oral, topical, or parenteral administration; fluids suitable for injection; or aerosols suitable for administration to an animal. The compositions may include a carrier.

According to a further aspect of the present invention, there is provided a method of treatment of a skin disorder in a canine, the method comprising administering a serum composition comprising anti-HLA antibody. It is believed that at least a component of the serum activity is linked with anti-HLA activity; the activity may reside in the antibody itself or in some other factor associated with the antibody. Preferably the anti-HLA antibody is goat anti-HLA antibody. The antibody may be polyclonal.

DETAILED DESCRIPTION OF THE INVENTION

Example of Production of Goat Serum

A goat was inoculated by intramuscular injection with lysed HIV viral cocktail and formulated with Freunds adjuvant. The virus was previously heat killed at 60°C for 30 minutes. Blood samples were drawn after an appropriate interval, such as two weeks, for initial assessment. In the optimised procedure, the goat is injected every week for four weeks, then at six weeks the animal is bled to obtain the reagent.

Approximately 400 cc of blood is drawn from the goat under sterile technique. The area for needle extraction is shaved and prepared with betadine. An 18-gage needle is used to draw approximately 400 cc of blood from the animal. Of note is that the animal can tolerate approximately 400 cc of blood drawn without the animal suffering any untoward effects. The animal does not have to be sacrificed. The animal can then be re-bled in approximately 10 to 14 days after it replenishes its blood volume.

The presence of potentially useful antibodies was confirmed, having regard to the desired antibody activity. Once the presence of such reagents was confirmed, blood was then taken from the goat at between 4-6 weeks.

The base blood product in order to create the reagent is then centrifuged to create the serum. 300 ml of serum was then filtered to remove large clots and particulate matter. The serum was then treated with supersaturated ammonium sulphate (45% solution to room temperature), to precipitate antibodies and other material. The resulting solution was centrifuged at 5000 rpm for five minutes, after which the supernatant fluid was removed. The precipitated immunoglobulin was resuspended in phosphate-buffered saline (PBS buffer, see Sambrook et al, 'Molecular Cloning: A Laboratory Manual', 1989) sufficient to redissolve the precipitate.

The solution was then dialysed through a membrane with a molecular weight cut off of 10,000 Daltons. Dialysis was carried out in PBS buffer, changed every four hours over a period of 24 hours. Dialysis was carried out at 4°C.

After 24 hours of dialysis the contents of the dialysis bag were emptied into a sterile beaker. The solution was adjusted such that the mass per unit volume = 10 mg per ml. The dilution was carried out using PBS. The resulting solution was then filtered through a 0.2 micron filter into a sterile container. After filtration, the solution was aliquoted into single dosages of 1ml and stored at -22°C prior to use.

Administration of serum

A 1 ml aliquot of serum, prepared as described, is adjusted to provide a dose of 0.1 mg/kg, and injected subcutaneously to a domestic dog suffering from atopic dermatitis.

Experimental Results

Four domestic dogs were treated with the serum. Summaries of their conditions and responses are as follows.

Summary for patient 1.

Primary condition for treatment: Chronic lick lesions over both carpii and right pes apparently associated with degenerative joint disease.

Concurrent active conditions and treatments: Polyarthropathy with bilateral carpal varus due to degenerative joint disease.

Apparent response to Treatment: After two injections owner left lick lesion uncovered and dog has not licked at since.

Adverse reactions: None reported.

Summary for patient 2:

Primary condition for treatment: Atopy and interdigital cysts – evening primrose oil

Concurrent active conditions and treatments: Multiple generalised sebaceous cysts that dog chews at: Inflammatory bowel disease – dietary management and protexin. Occasional injection of dexadreson to manage acute flare up. However extended steroid treatment (inhaled or tablet) results in marked side effects. Chronic allergic respiratory disease – responds to Piriton and inhaled steroids

Apparent response to Treatment: Over the course of one months treatment with serum noticeable improvement in condition of skin and coat. Decreased inflammation associated with generalised sebaceous cysts. Since treatment no episodes of inflammatory bowel disease has occurred.

On stopping Piriton the respiratory signs recurred despite treatment.

Adverse reactions: Increased appetite reported.

Summary for patient 3:

Primary condition for treatment: Progressive alopecia with borderline low thyroid levels (awaiting skin biopsy results).

Concurrent active conditions and treatments: Upper respiratory noise especially when excited, no evidence of collapsing trachea.

Apparent response to Treatment: Only one injection so far.

Adverse reactions: None reported.

Summary for patient 4

Primary condition for treatment: Atopy

Concurrent active conditions and treatments: Persistently elevated ALT and ALKP but despite investigation no cause of this has been identified.

Apparent response to Treatment: Only one Daval injection so far.

Adverse reactions: After first injection on returning home, owner reports hyperexcitable and running around house.
